

M-INDICATOR

APP REDESIGN PROJECT

By:

Yateen Vaviya- 2023300251

Shaunak Kokate - 2023300121

Aniruddh Saraf - 2023800099

Sania Rakhanghi - 2023300180

Tanish Rane - 2023300184

Preksha Salvi - 2023300193

Krish Sodhi - 2023300233

Primary research

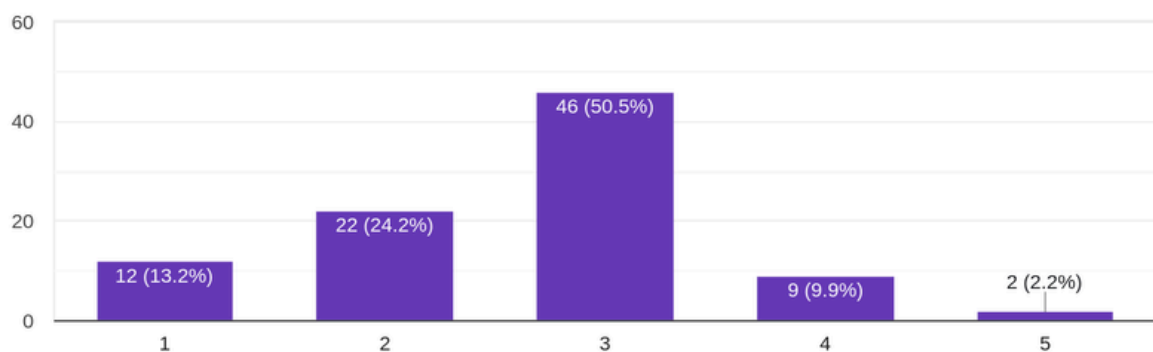

By Talking to metro and railway travelers, we found that M-indicator while still popular, is frustrating users due to poor UI, leading to some ditching it for competitors or dreading using it. [View the results](#)

How visually appealing do you find the design of the app?

 Copy chart

91 responses

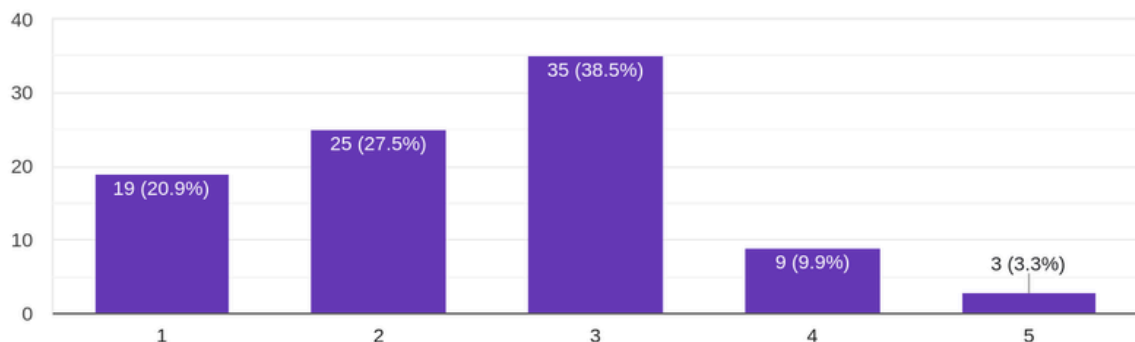

Users find the design of the app very old and clunky to use

How easy is it to navigate through the app?

 Copy chart

91 responses

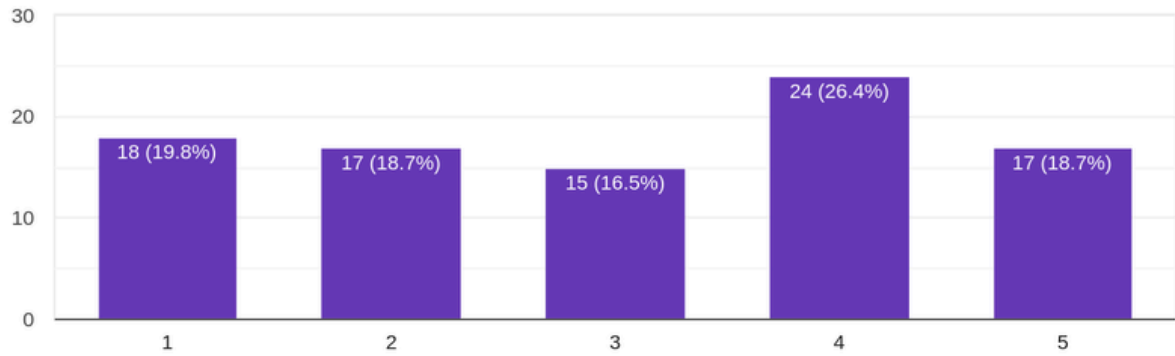

Users find the UI unintuitive

Is it easy to check for trains/metro on the app?

 [Copy chart](#)

91 responses

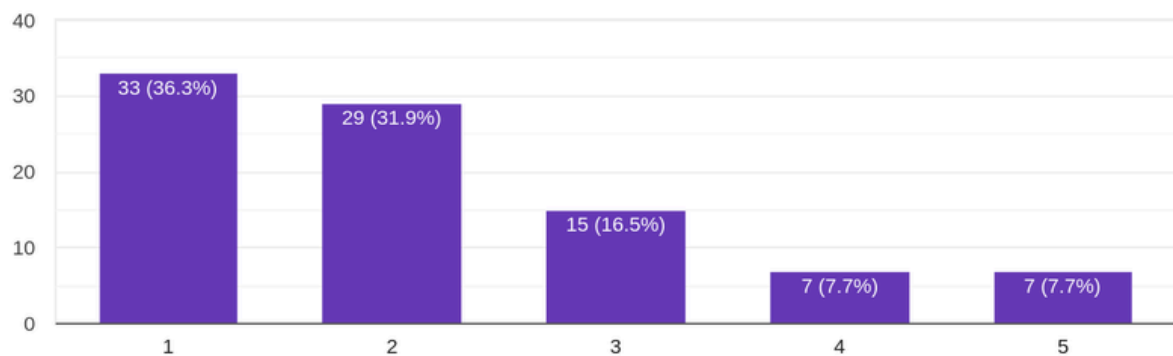

Users have mixed feelings on the easy of use of the application, primarily due to level of familiarity

Is the layout of the app cluttered?

 [Copy chart](#)

91 responses

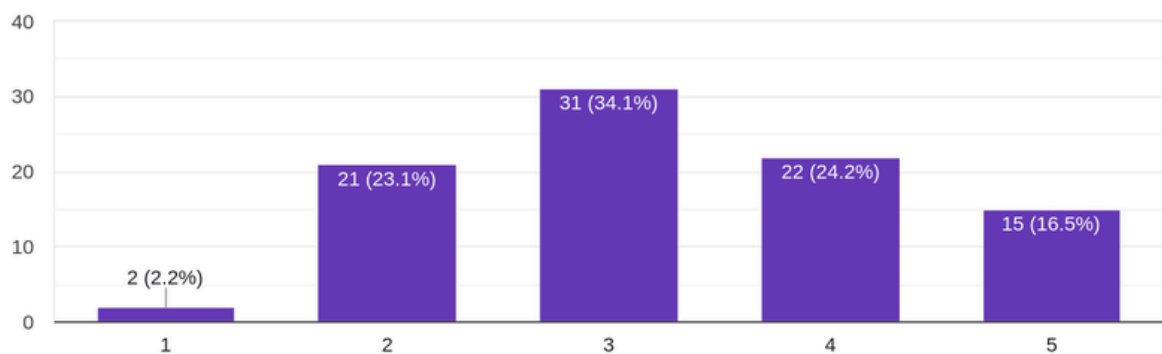

Users feel that the UI is cluttered with useless features

How satisfied are you with the App?

 [Copy chart](#)

91 responses

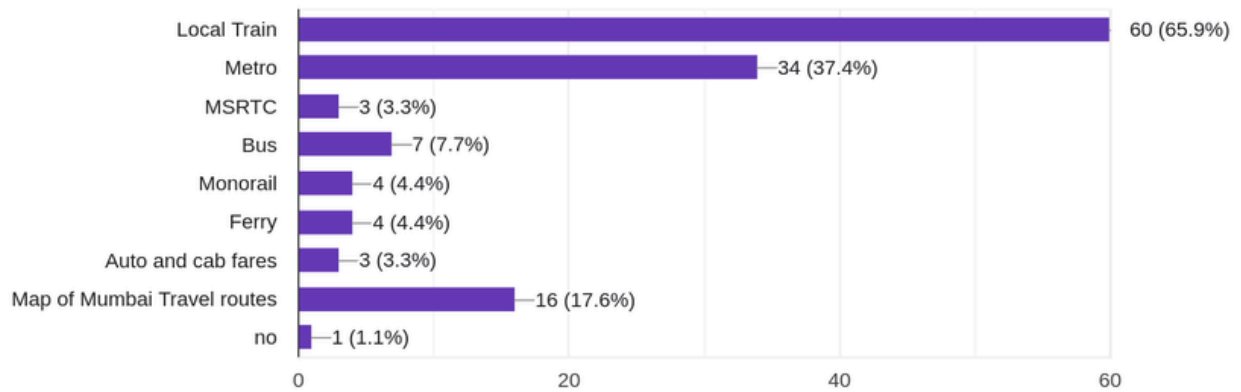

Users feel the app does its job, but are dissatisfied with its UI and clunkyness due to features they rarely use

What do you use the M-Indicator app for?

 Copy chart

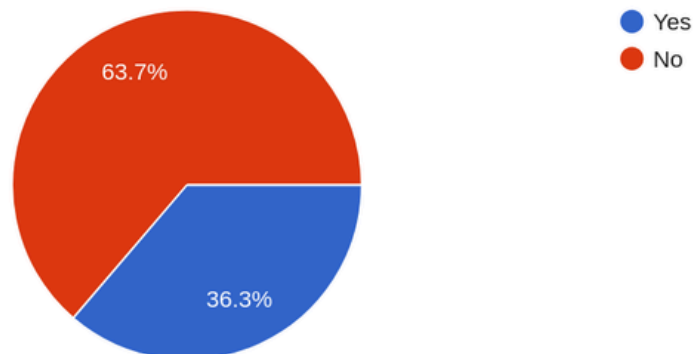

91 responses

The primary use of the app is for local train and metro, yet the app does not prioritize these aspects in its UI

Do you face frequent errors on the app?

91 responses

Errors like features not working are a common occurrence

Secondary research

By examining app reviews on Google play store we found that M-indicator received negative reviews from users who primarily expressed their dissatisfaction with the app's cluttered UI, repetitive actions , confusing navigation, ad placements and half baked features.

★☆☆☆☆ 7 May 2025

Hi, The contact details you have provided in the emergency section under "Casualty" need to be updated. I tried calling G T Hospital, but the call isn't going through. Considering people may be in emergencies, please update the contact details with numbers that are reachable. please do needful and confirm me. follow up The contact details have not been changed yet. Can you tell me when the contact details will be changed?

Users face issues with outdated or unreachable emergency contact information in the app.

A Google user

★☆☆☆☆ 13 September 2019

Please add details of return trains. Like which train becomes which from Borivali if I board from Malad. As many people travel like this during peak hours. Also you can add which all stations and platform have escalators for convenience of senior citizens and specially abled people. And I'll give it 5 stars. I had posted this 2 years back. Still no update or reply. Also live tracking of BEST buses ? Will be a great feature.

1 person found this review helpful

Did you find this helpful?

Yes

No

Users want return train details, station accessibility info, and live tracking features for better travel planning.

Vihang Shah

★ ★ ★ ★ ★ 27 November 2024

User Interface is too old. Needs revamp. Also train timetables and bus timetables are not updated. Also live tracking system is not working as of now for local as well as express trains. So will increase rating once above improvements are done. Still awaiting changes.

7 people found this review helpful

Did you find this helpful?

Yes

No

Users find the UI outdated and face issues with inaccurate or missing live train and bus timetable updates.

★ ★ ★ ★ ★ 5 June 2022

Too many ad placements in the UI makes the UX a nightmare. You can't go back by clicking on the back button smoothly since you have to view the ad then it will provide a button to close the ad once it's over. It's an annoying part Mobond can start an annual subscription instead for the service at least.

10 people found this review helpful

Users find the excessive ad interruptions in the app frustrating and disruptive to navigation.

Yogesh Khandalkar

★☆☆☆☆ 10 August 2022

Earlier the app was good. But now one can not find local timings easily. Everytime have to select source and destination even if rout is added in favourite. Also many times no trains available message displays... Disappointed from a very useful app...

Yes

No

Mobond

12 August 2022

Hi, sorry for the inconvenience caused. Can you please share the details of the issue at support@mobond.com so that we can check and assist you better. Thanks!

Users struggle to find local train timings and must repeatedly enter source/destination despite using the favorites feature.

Kaushik Raichura

★☆☆☆☆ 15 October 2021

The new version is horrific. The earlier one had the option of viewing trains through systematic categories like Central, Western, etc. but the new one only has one option - enter source and destination which is way more difficult to use. After all this ruckus, we have to "add" train without which we can't even see the route.

249 people found this review helpful

Did you find this helpful?

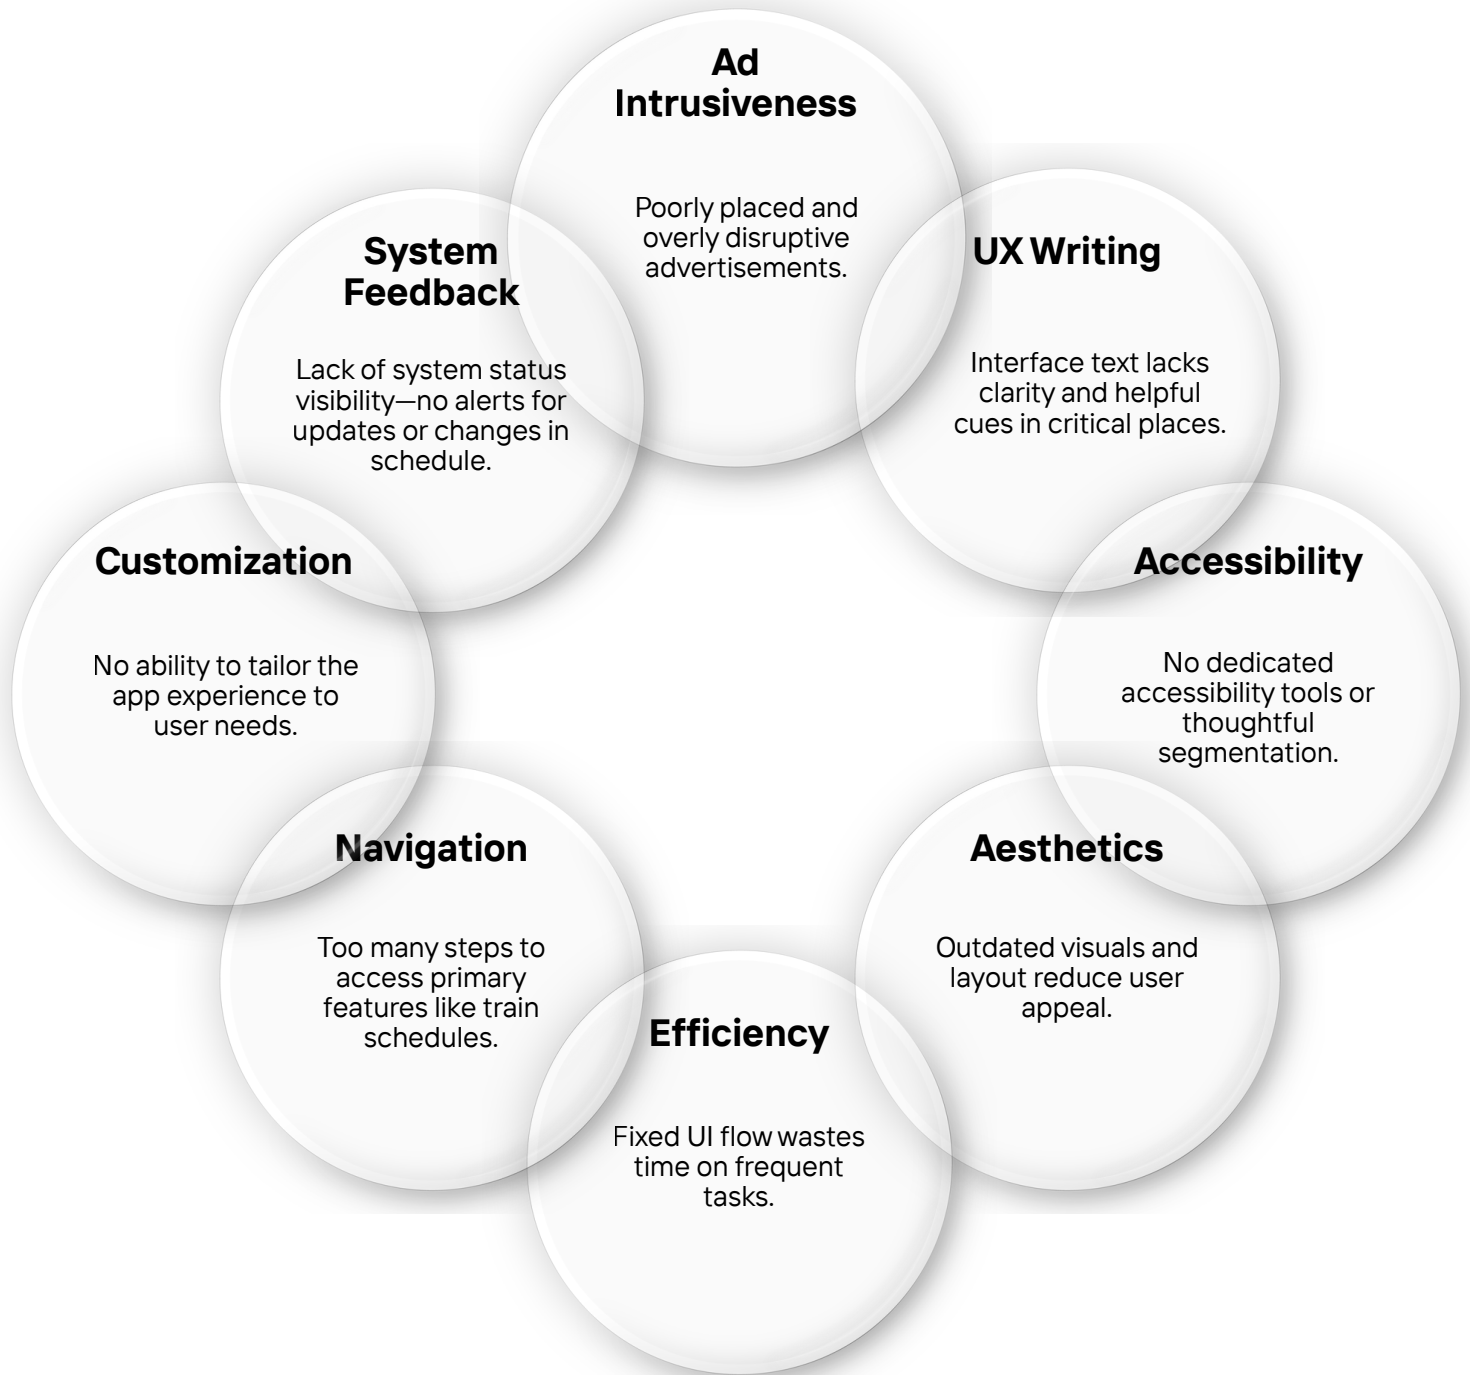

Yes

No

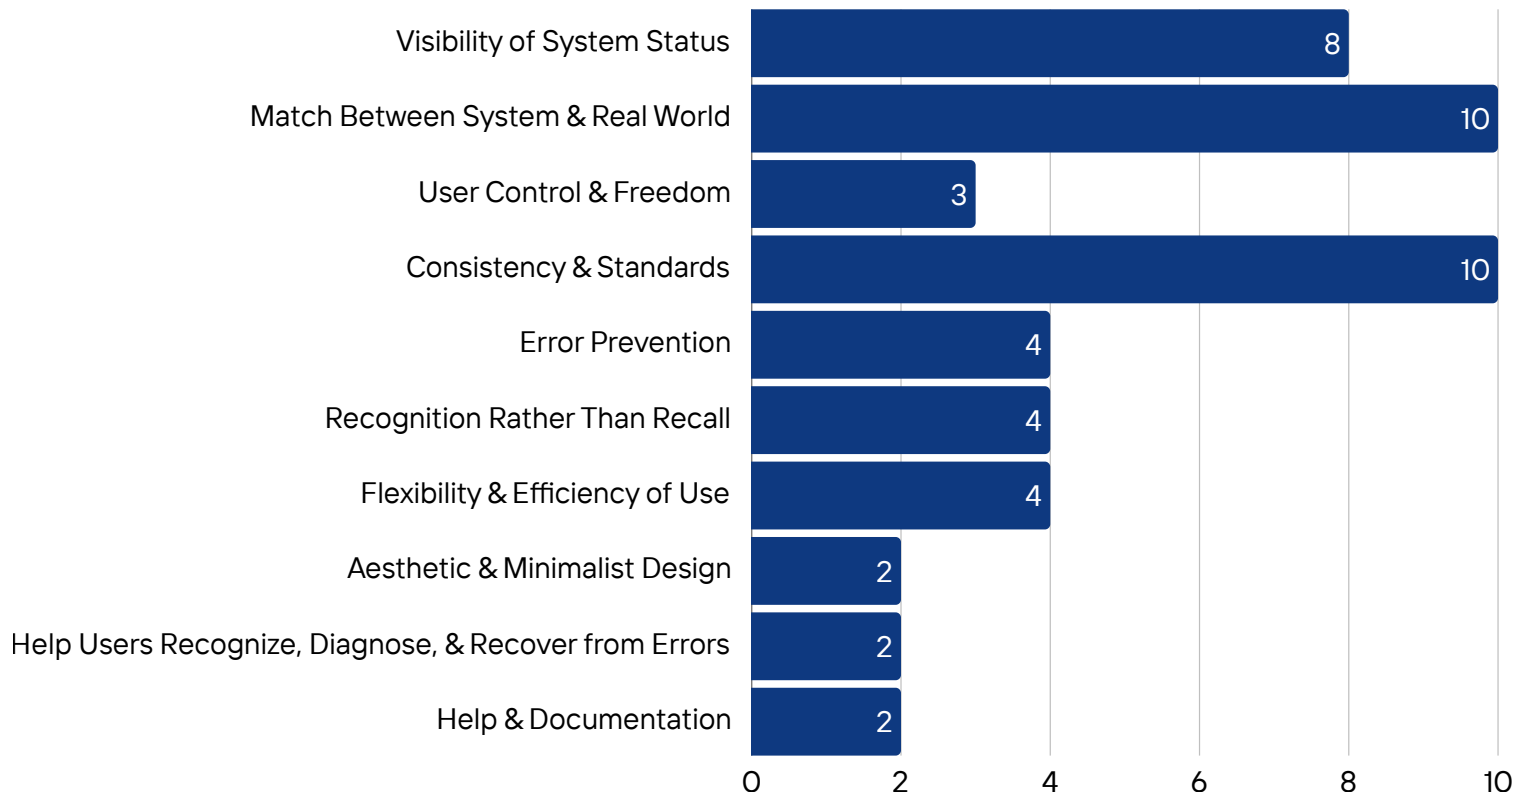

Users find the new version harder to use due to the removal of categorized train listings.

Pain Points

Heuristic Rating

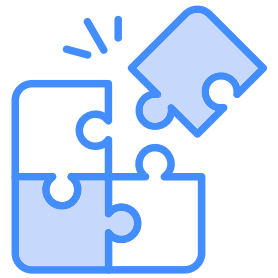

Clear and Simple Language: Uses vocabulary that is easy to understand and aligns with everyday users' language.

- **Lack of System Status Visibility:** No notifications for updated or changed train timetables, leading to potential reliance on outdated information.
- **No Built-in Support:** Absence of customer support or contact options for users facing issues.
- **Limited Customizability:** Users cannot tailor the app based on their specific interests or needs (e.g., train-only users must navigate unrelated sections).
- **Rigid Navigation Structure:** Common tasks require multiple clicks and menu layers, reducing efficiency and user-friendliness.
- **Low Flexibility:** The app's fixed structure hinders fast access to frequently used features, affecting overall usability.

Problem Statement

Users are experiencing frustration due to the app's cluttered interface, confusing navigation structure, repetitive user actions, and poorly placed advertisements. Additionally, several features feel incomplete or non-functional, leading to decreased trust and a lack of engagement with the app. These issues result in a disjointed user experience and hinder users from accomplishing key tasks efficiently.

Goal Statement

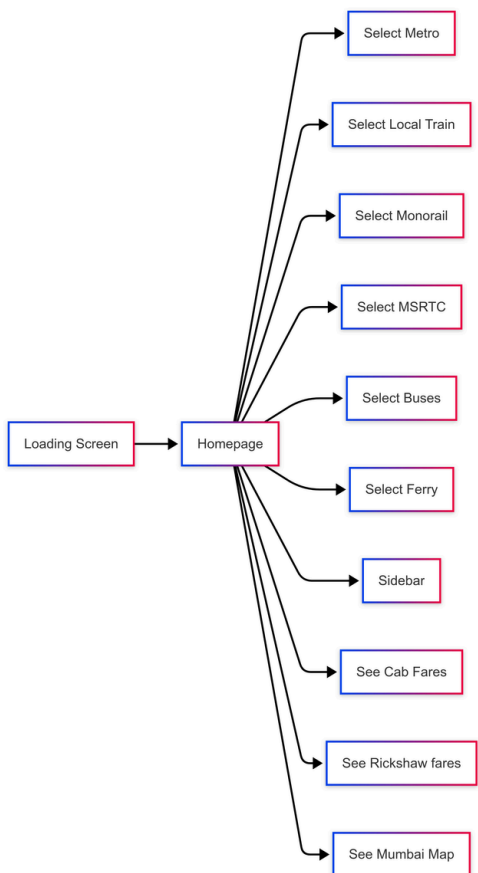

Redesign the app with a focus on simplifying the user interface, streamlining navigation, minimizing repetitive steps, and improving the clarity and placement of features. The goal is to eliminate distractions like intrusive ads, enhance the overall usability guided by heuristic principles, and deliver a polished, intuitive, and seamless experience that empowers users to achieve their goals with confidence.

Home Page Redesign

User Flow

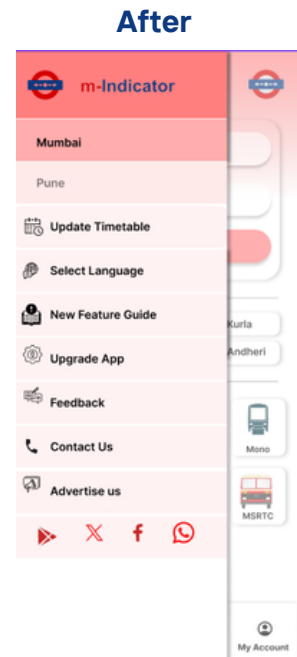

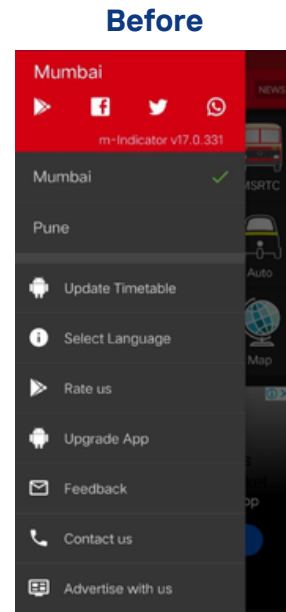

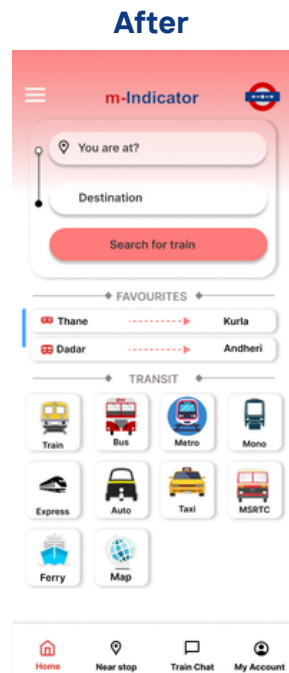

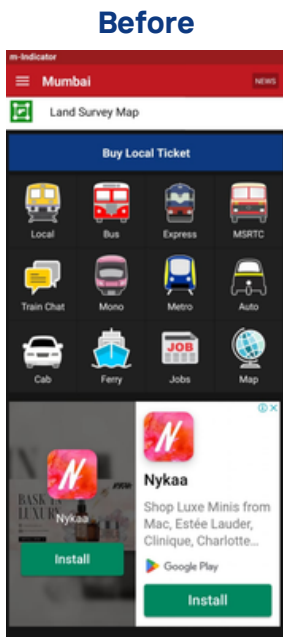

In the redesigned m-Indicator app, users land on a clean home screen with a search-focused layout where they can quickly enter their current location and destination. Transit options like bus, metro, and taxi are clearly organized under a unified visual section. Favorite routes are conveniently displayed for quick access. The navigation drawer has also been redesigned with a lighter aesthetic, rounded buttons, and improved visual hierarchy, making features like timetable updates, language selection, and feedback more discoverable and user-friendly.

User Journey

- User opens the app and is greeted with a clean, search-focused home screen.
- Enters current location and destination in the prominent search bar.
- Can view and select favorite stations/routes listed just below the search bar.
- Scrolls to explore transit options like Train, Bus, Metro, Taxi, etc., shown as intuitive icons.
- Uses the bottom navigation bar to quickly access features like:
 - Near stop
 - Train Chat
 - My Account
- Opens the side menu to:
 - Switch between Mumbai and Pune regions
 - Update timetable
 - Select language
 - Access the new feature guide
 - Upgrade app, give feedback, or contact support
- Social media and support icons are easily accessible at the bottom of the side menu.

Before and After Screens

Home Screen

Before:

- The home screen uses dark theme tiles with icons for different transport modes.
- Ads are large and prominently placed at the bottom, reducing focus on core features.

After:

- A cleaner, brighter interface with a prominent search bar for origin and destination.
- Transport modes are shown as minimalistic icons under a "Transit" section, with less intrusive ads.
- Favorites and key routes are also highlighted for quick access.

Navigation Drawer/Menu

Before:

- Uses a dark overlay menu with icons and text links.
- Options like "Update Timetable," "Rate Us," and "Select Language" are stacked vertically.

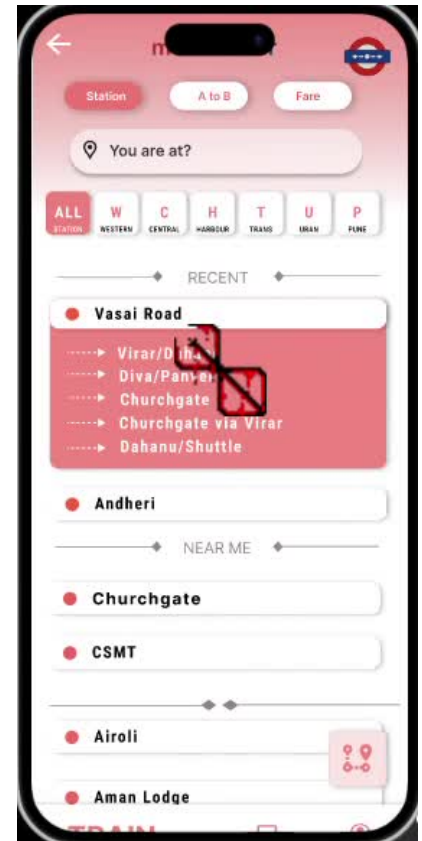

After:

- The menu adopts a light theme matching the main UI, with rounded containers and icons.
- A new "Feature Guide" option is added, and social media icons are visually refined at the bottom.
- Transitions more smoothly from the main screen, improving consistency.

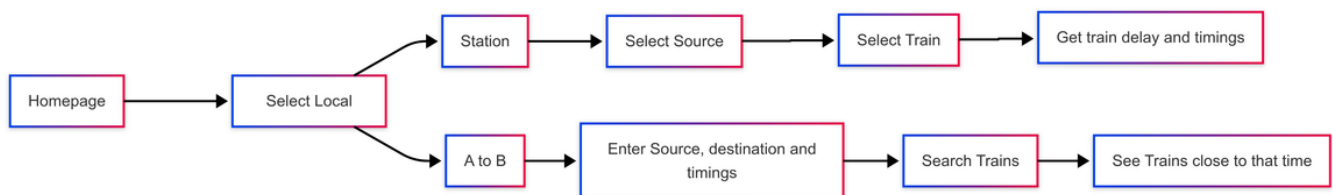

Local Train Section Redesign

User Flow

We have made several changes in the Local train section of the app. The UI is made to be a lot more cleaner compared to the previous one. Moreover, we have made the UI much more pleasant and soothing to the user using pastel colors. We have also added additional shortcuts to this section like added a recent section where the stations most visited by the user are shown and also the Stations that are closer to the user's location

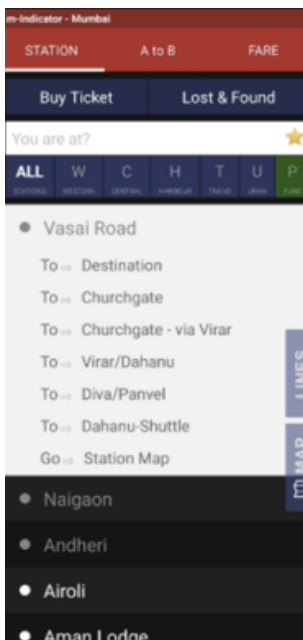

User Journey

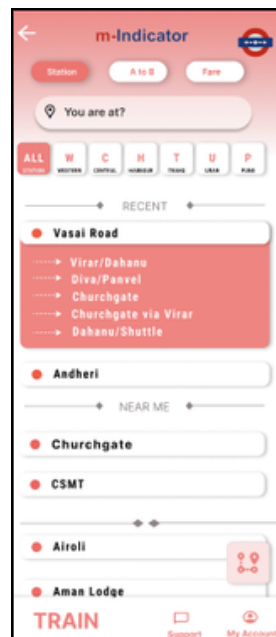

- The flowchart illustrates the user navigation process for accessing local train information through two primary paths starting from the homepage.
- After selecting the "Select Local" option, users can either choose the Station-based path to view train delays and timings by selecting a specific station, source, and train, or follow the A to B journey-based path, where they enter a source, destination, and preferred time to search for trains and view options close to that time.
- This dual approach caters to both users seeking real-time updates for a known train and those planning trips between two locations.

Before and After Screens

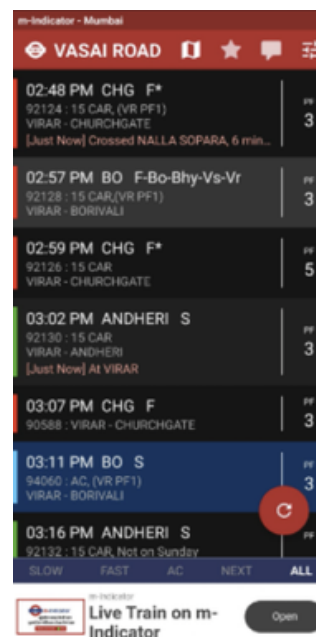

Before

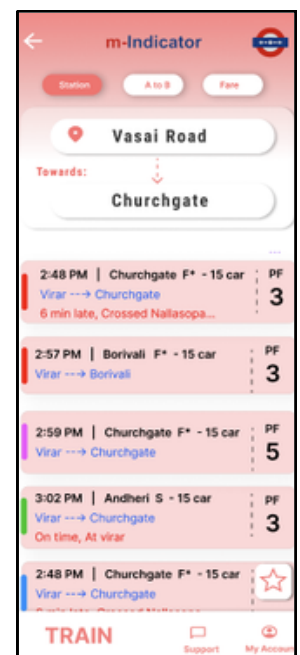

After

Before

After

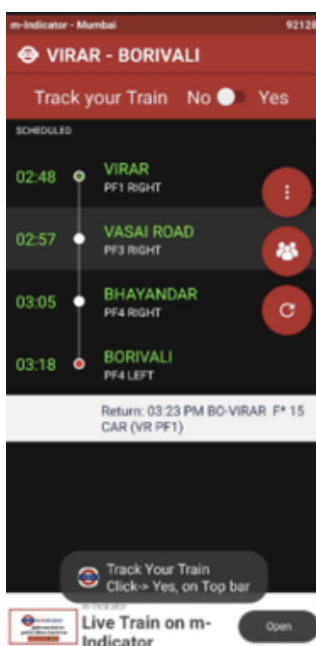

1. Select Station Screen:-

- Old:- Congested list of stations with no priority to recent stations
- New:- Improved Spacing and Lighter theme with improved Readability

2. Select Train Screen:-

- Old:- Congested list of Trains with useless information like train number
- New:- Improved Spacing and Simplicity with a lighter theme

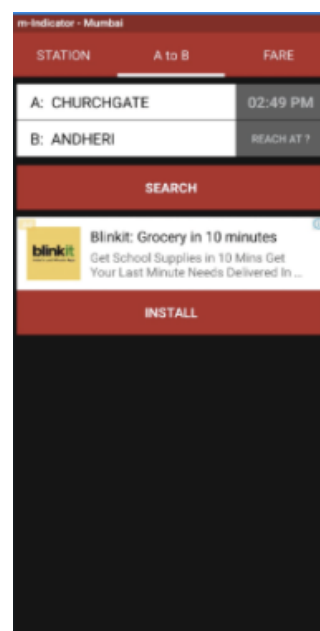

Before

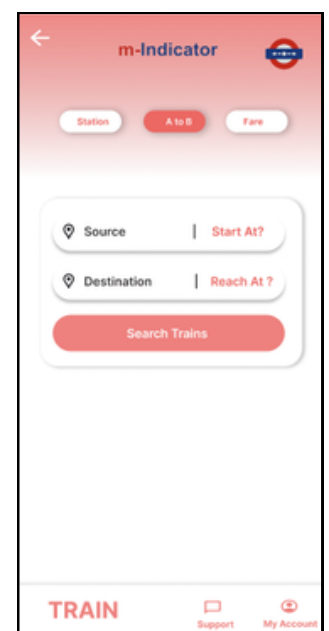

After

3. Select Train Stops Screen:-

- Old:- Dark List with a lot of unnecessary buttons
- New:- Improved Spacing and Lighter theme with improved Readability and simplicity

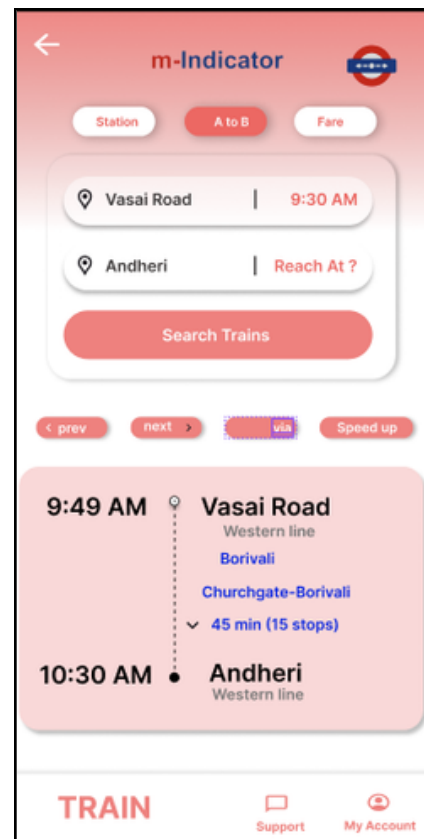

4. Select A to B Screen:-

- Old:- Visually unappealing UI, Separate screen without any justifiable reason
- New:- Lighter Theme with train timings on same page for clarity

Before

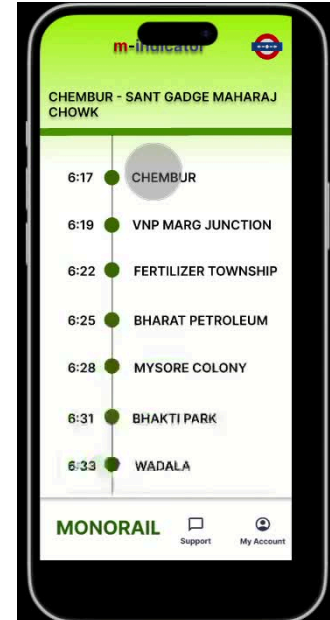

After

Monorail Section Redesign

User Flow

The user first enters in which station he is present currently. after that he gets the option as to what direction he wants to pursue his/her path, he gets all the times when the monorail comes on his specific station. After specifying the time, the user gets the exact path of his journey and which all stations will he/she have ahead of him/her

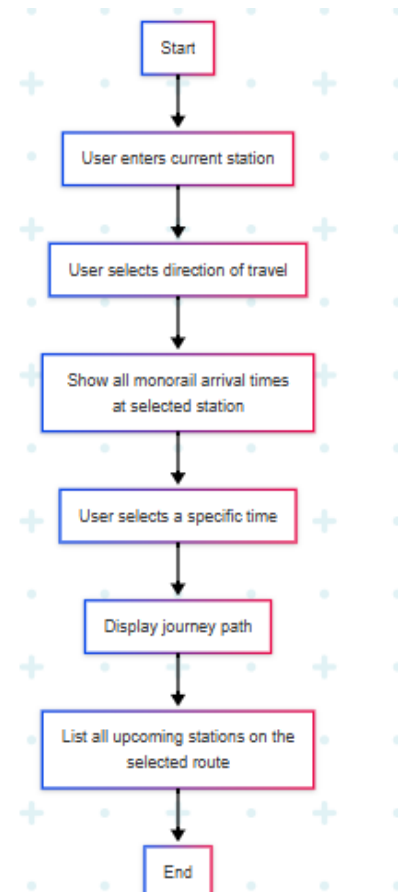

Flowchart

In the updated Monorail section of the M Indicator app, we've made the flow more intuitive by changing the sequence of inputs. Earlier, users had to select a direction first, which often caused confusion. Now, the user is first asked to enter their current station. Based on that, they are then prompted to choose the direction they want to travel.

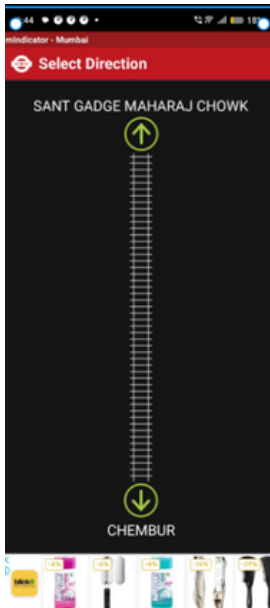

Once the direction is selected, the app shows all upcoming monorail arrival times at that station. The user picks a specific time, after which the app displays the journey path along with a list of upcoming stations on that route.

This change makes the process more logical and user-friendly by starting with the most familiar detail: the user's current location.

Before and After Screens

Before

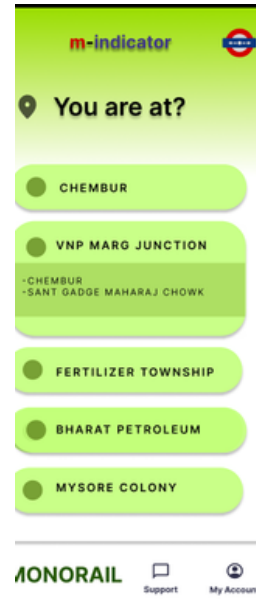

After

Before

After

Here before asking the direction of flow straight away from the user i have first asked the user that on which station he/she is

Here in my updated page i have given the choice of direction to the user after he /she selects their current station

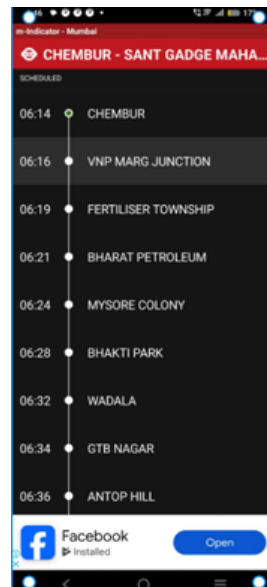

Before

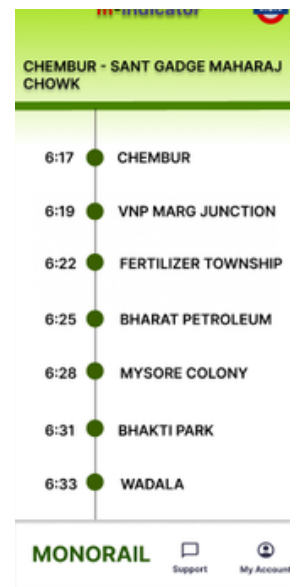

After

Before

Here i have given a more cleaner and asthetic touch to the seemingly cluttered UI.

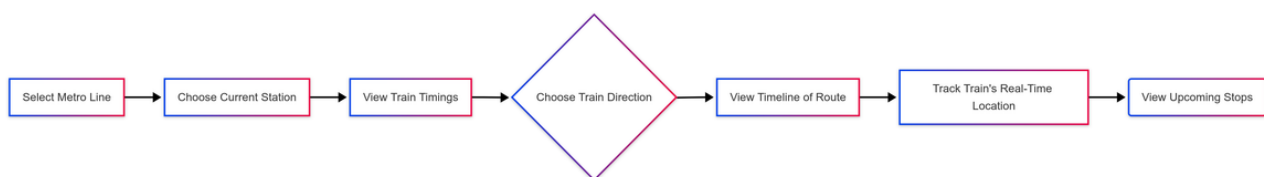

Metro Section Redesign

User Flow

In the redesigned metro app, the user begins by selecting a metro line from a clean, card-style interface. They are then prompted to choose their current station from a visually accessible list of large, tappable buttons. Upon selecting a station, the app displays available train timings in both directions using neatly formatted cards. Tapping on a direction reveals a clear timeline view of the route, with each station and its corresponding train time shown in a scrollable list. The user can also expand sections to track the train's real-time location and view upcoming stops. The flow is intuitive, visually organized, and designed to provide quick access to essential metro information.

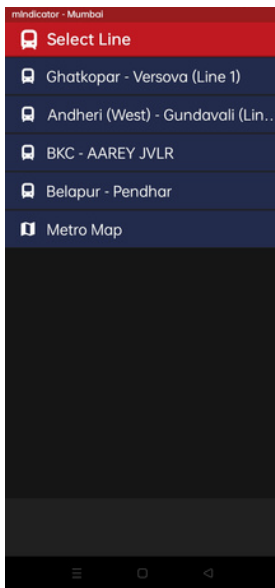

Flowchart

- The user starts by selecting a metro line from a clean, card-style interface.
- Next, they choose their current station from a visually accessible list with large, tappable buttons.
- Once a station is selected, the app shows train timings in both directions using neatly formatted cards.
- Tapping a direction reveals a timeline view of the route, listing stations with their corresponding train times.
- Users can expand sections to track the train's real-time location and view upcoming stops.
- The entire flow is intuitive, visually organized, and designed for quick access to essential metro travel information.

Before and After Screens

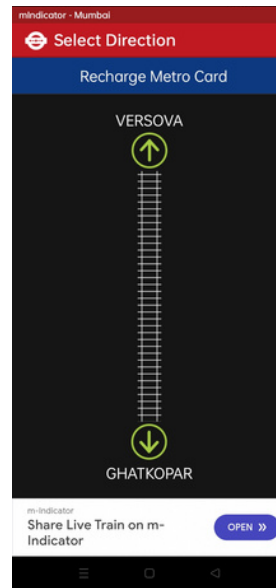

Before

After

Before

After

1. Select Line Screen

- Old: Dark theme with minimal spacing and simple list items.
 - New: Light theme with card-style buttons, improved spacing and readability.
- Creates a more modern, user-friendly look with better visual separation.

2. Select Station (You are at?)

- Old: Dense vertical list on a black background with no emphasis on selection.
 - New: Light blue background with large, tappable station buttons and highlighted selection.
- Enhances accessibility and makes navigation easier.

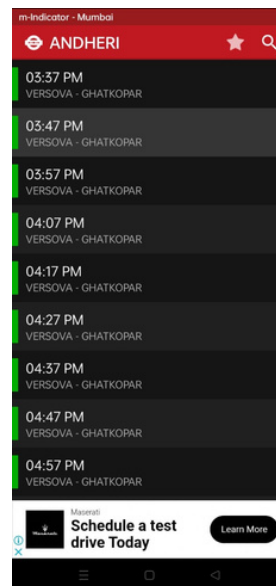

Before

After

Before

After

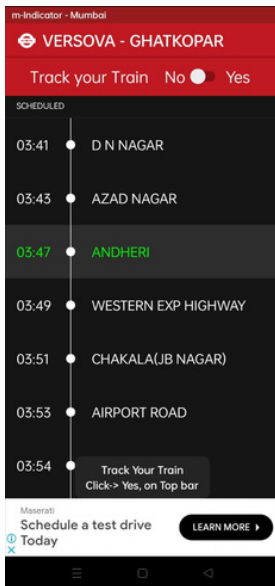

3. Station Details (You are at Andheri)

- Old: Compact dark list with small fonts and unclear direction info.
 - New: Spacious cards for train timings and clear direction indicators.
- Improves readability and highlights key actions like choosing direction.

4. Train Timings – Andheri

- Old: Dark vertical list with minimal styling and cluttered information.
 - New: Light theme with station bubbles and neatly aligned timings.
- Offers a cleaner timeline with better station-time pairing.

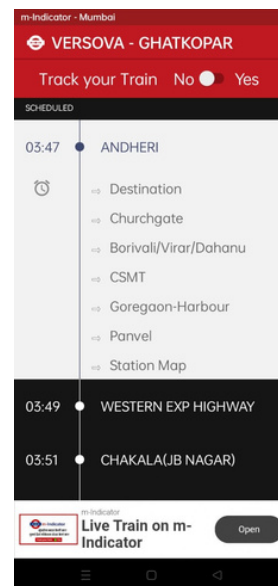

Before

After

After

5. Train Timings – Versova to Ghatkopar

- Old: Dark vertical list with minimal styling and cluttered information.
 - New: Light theme with station bubbles and neatly aligned timings.
- Offers a cleaner timeline with better station-time pairing.

6. Train Timings – Versova to Ghatkopar (Expanded View)

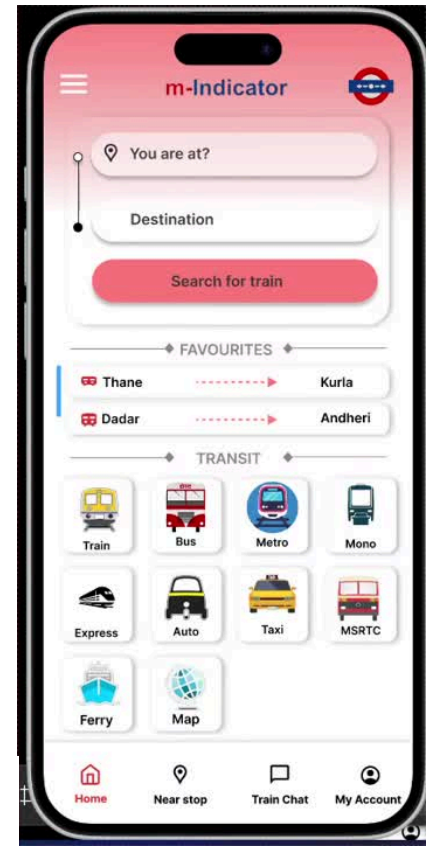

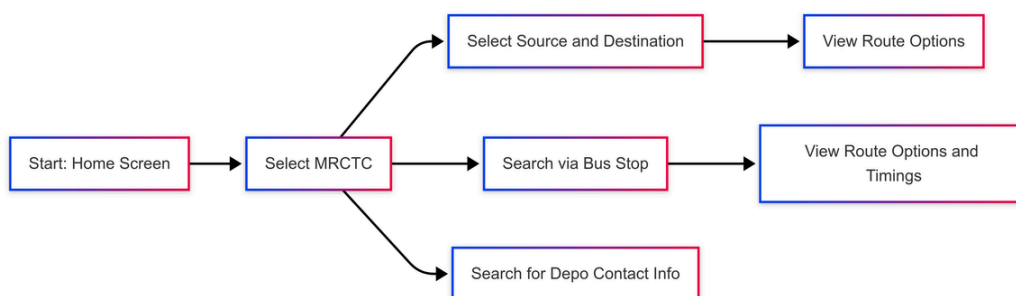

- Old: Plain list without interactive elements and unclear current status.
 - New: Dropdown-style sections for routes and expanded station details.
- Makes real-time tracking intuitive and allows users to focus on what's relevant.

MSRTC Section Redesign

User Flow

The user enters the source and destination stations, then taps on "Search Buses." A list of cities or stops appears for selection. After choosing a route, the app displays all available buses with timings, route info, bus type, and live status. Users can also view schedules from specific bus stops or check depot contact numbers for help.

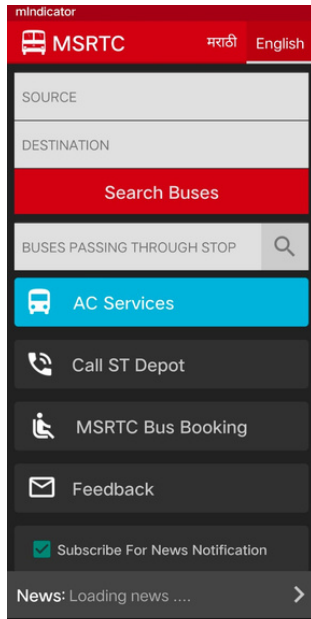

Flowchart

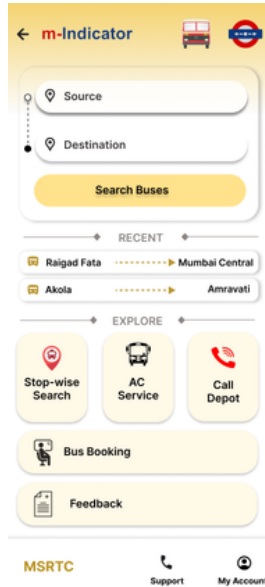

- The user begins on a home screen featuring easily tappable options.
- From there, they select MSRTC, which opens up three clear paths.
- First, the user may enter a source and destination, followed by selecting a city from a list. They are then shown route options, each presented as a tidy card with essential bus details.
- Alternatively, the user can search via a specific bus stop. This leads to a screen displaying bus timings in both directions, helping users plan effectively. Selecting a specific time reveals further route and stop details.
- There is also a third option to search for depot contact information, enabling users to get in touch with the relevant authorities for help or booking.
- The overall experience is organized, efficient, and user-friendly, offering fast access to MSRTC route details, timings, and contact support – all within a well-structured flow.

Before and after pages

Before

After

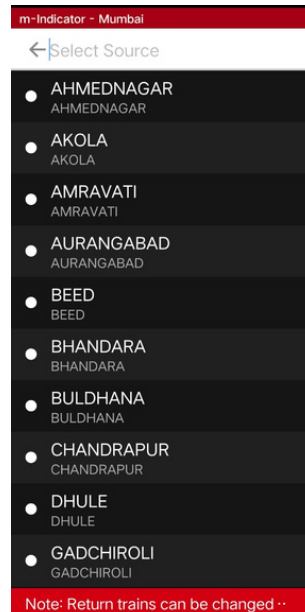

1. Home Screen

Old: Flat red theme, small buttons, and crowded service list.

New: Clean layout with modern icons, soft color palette, and quick service access (e.g., AC Services, Feedback).

► Improves navigation and highlights important actions upfront.

Before

After

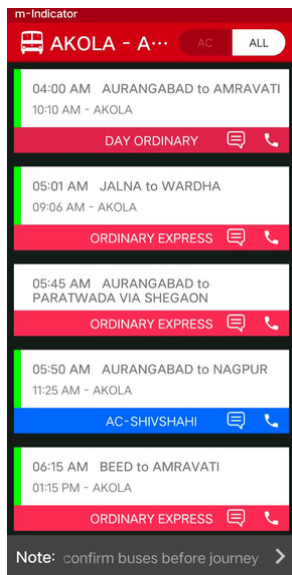

2. Source Selection

Old: Dropdown in dark theme with minimal spacing between options.

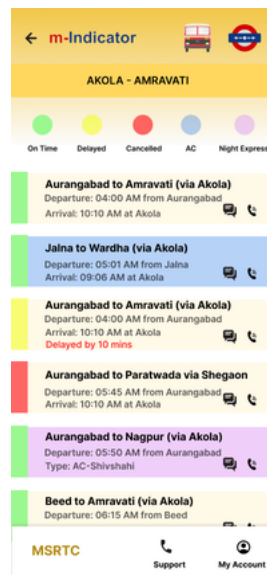

New: Scrollable, card-style list of cities with good spacing and touch targets.

► Enhances readability and selection accuracy.

Before

After

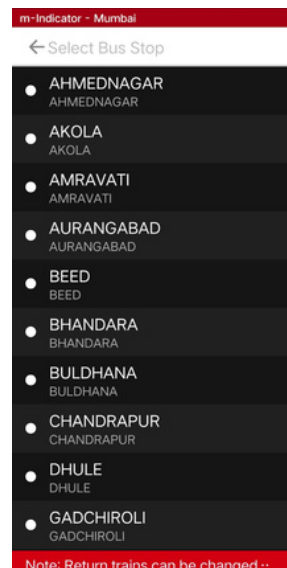

3. Bus Timings & Routes (e.g., Akola - Amravati)

Old: List of buses with tight spacing, unclear color usage, and smaller fonts.

New: Color-coded bus types with clearly marked routes, timings, and live indicators.

► Boosts visibility and simplifies route differentiation.

Before

After

4. Stop Selection (within city)

Old: Dark dropdown with little distinction between stops.

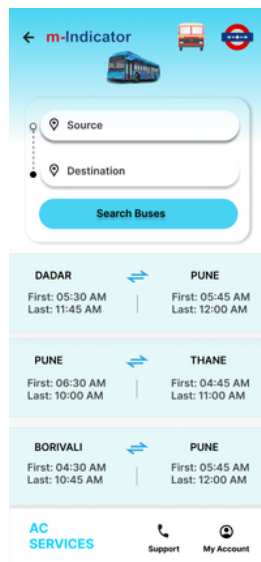

New: Tappable list with a light background, better spacing, and consistent stop names.

► Improves clarity and touch usability.

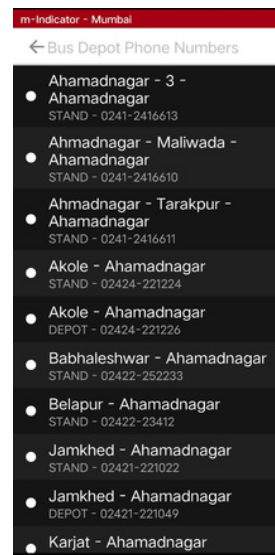

Before

After

Before

After

5. Direct Timings (e.g., Pune – Thane)

Old: Cluttered interface with static info and small text.

New: Clean, modern blue layout showing multiple city pairs and respective timings.

► Simplifies schedule scanning with better visual grouping.

6. Bus Depot Contact Info

Old: Long text blocks in dark UI, phone numbers buried in text.

New: Card-style view per depot with clearly labeled STAND/DEPOT numbers and names.

► Makes it easy to call or identify the right depot quickly.

Ferry Section Redesign

User Flow

The user select ferry from homepage and then the user can type source destination to filter the ferry details , otherwise all possible ferries are already displayed on the home screen.

Bus Section Redesign

User Flow

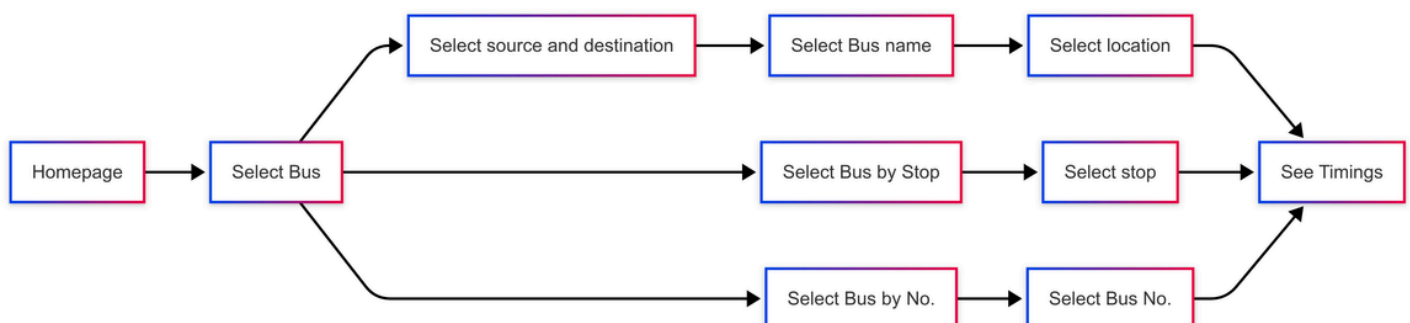

When a user selects the bus option among other transit choices on the home screen, they have three methods to find buses:

- Search by Source & Destination
- Search by Bus Number
- Search by Current Bus Stop

Once a method is chosen, a list of available buses will appear. By clicking on the clock button, users can view the bus route and its timings. Alternatively, if they select the "Search by Home" button, they can look up their preferred bus number and access its details. If they opt for the "Search by Bus Stop," they will receive information about the buses that visit that specific bus stop.
